## CERTAIN OPERATORS AND FOURIER TRANSFORMS ON $L^{2}$

RICHARD R. GOLDBERG

1. Introduction. A well known theorem of Titchmarsh [2] states that if $f \in L^{2}(0, \infty)$ and if $g$ is the Fourier cosine transform of $f$, then $G(x)=x^{-1} \int_{0}^{x} g(y) d y$ is the cosine transform of $F(y)=\int_{\nu}^{\infty}(f(x) / x) d x$ (both $F$ and $G$ being in $L^{2}$ ). The same result applies to sine transforms.

In this paper we prove the following result for a wide class of functions $\psi$ : If $g$ is the cosine transform of $f \in L^{2}$ then

$$
G(x)=x^{-1} \int_{0}^{\infty} \psi(y / x) g(y) d y
$$

is the cosine transform of $F(y)=\int_{0}^{\infty} x^{-1} \psi(y / x) f(x) d x$. (The same result again applies to sine transforms.) The theorem of Titchmarsh stated above is the special case of our result in which $\psi$ is the characteristic function of $(0,1)$.

We shall prove the above result by developing properties of a certain class of bounded operators on $L^{2}$.

Finally we shall construct a class of self-adjoint bounded operators which commute with the Fourier cosine (or sine) transform.
2. Preliminaries. We shall denote $L^{p}(0, \infty)$ by $L^{p},(p=1,2)$ with the $L^{p}$ norm $\|f\|_{p}$ defined as usual as $\left(\int_{0}^{\infty}|f(x)|^{p} d x\right)^{1 / p}$. If $T$ is a linear transformation on $L^{2}$ into itself then $\|T\|$ is defined as

$$
\operatorname{lub}_{0 \in L^{2}}\|T g\|_{2} /\|g\|_{2} .
$$

We shall make use of the
Schwarz Inequality: if $f, g \in L^{2}$ then $f g \in L^{\prime}$ and $\|f g\|_{1} \leqq\|f\|_{2}\|g\|_{2}$, and its

Converse: if for each $h \in L^{2},\|G h\|_{1} \leqq A\|h\|_{2}$ then $G \in L^{2}$ and $\|G\|_{2} \leqq A$.

## 3. A Class of bounded operators on $L^{2}$.

Lemma. If $\psi(y) \geqq 0$ and $\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y=A<\infty$ then for any $g, h \in L^{2}$

$$
\int_{0}^{\infty} \psi(y) d y \int_{0}^{\infty}|h(x) g(x y)| d x \leqq A\|h\|_{2}\|g\|_{2 .}
$$

Proof. For $y>0$
Received by the editors October 30, 1958.

$$
\int_{0}^{\infty}|g(x y)|^{2} d x=\frac{1}{y} \int_{0}^{\infty}|g(x)|^{2} d x
$$

Therefore, by the Schwarz Inequality,

$$
\int_{0}^{\infty}|h(x) g(x y)| d x \leqq\|h\|_{2} \cdot \frac{1}{y^{1 / 2}}\|g\|_{2} .
$$

Hence

$$
\int_{0}^{\infty} \psi(y) d y \int_{0}^{\infty}|h(x) g(x y)| d x \leqq\|h\|_{2}\|g\|_{2} \int_{0}^{\infty} \psi(y) y^{-1 / 2} d y=A\|h\|_{2}\|g\|_{2}
$$

The first part of the next theorem was proved in a much different form by Schur [1].

Theorem 1. Let $\psi$ be non-negative with $\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y=A<\infty$. Let $\psi$ define the linear transformation $T$ on $L^{2}$ as follows:

$$
T g=G \text { means } G(x)=\frac{1}{x} \int_{0}^{\infty} \psi\left(\frac{y}{x}\right) g(y) d y \quad\left(g \in L^{2}\right) .
$$

Then $T$ is a bounded operator on $L^{2}$ and $\|T\| \leqq A$.
Furthermore if we define $T^{*}$ as

$$
T^{*} f=F \text { means } F(x)=\int_{0}^{\infty} \frac{1}{y} \psi\left(\frac{x}{y}\right) f(y) d y \quad\left(f \in L^{2}\right),
$$

then $T^{*}$ is the adjoint of $T$ and so $\left\|T^{*}\right\| \leqq A$.
Proof. We shall first show that $G \in L^{2}$ and that $\|G\|_{2} \leqq A\|g\|_{2}$.
For any $h \in L^{2}$ we have

$$
\begin{aligned}
& \int_{0}^{\infty}|G(x) h(x)| d x \leqq \int_{0}^{\infty} \frac{|h(x)|}{x} d x \int_{0}^{\infty} \psi\left(\frac{y}{x}\right)|g(y)| d y \\
& =\int_{0}^{\infty}|h(x)| d x \int_{0}^{\infty} \psi(y)|g(x y)| d y=\int_{0}^{\infty} \psi(y) d y \int_{0}^{\infty}|h(x) g(x y)| d x
\end{aligned}
$$

The last iterated integral converges (absolutely) by the lemma justifying the change in order of integration. Thus by the lemma

$$
\|G h\|_{1} \leqq A\|g\|_{2}\|h\|_{2} .
$$

The converse of the Schwarz Inequality thus implies that

$$
G \in L^{2} \quad \text { and } \quad\|G\|_{2} \leqq A\|g\|_{2}
$$

Since $G=T g$ this shows that $\|T g\|_{2} \leqq A\|g\|_{2}$ for all $g \in L^{2}$ and so $T$ is a
bounded linear transformation on $L^{2}$ into itself (bounded operator) and $\|T\| \leqq A$. The first part of the theorem is thus established.

Now choose any $f, g \in L^{2}$. Then with $(a, b)$ defined as $\int_{0}^{\infty} a(x) b(x) d x$, the usual inner product in $L^{2}$, we have

$$
\begin{equation*}
(T g, f)=\int_{0}^{\infty} \frac{f(x)}{x} d x \int_{0}^{\infty} \psi\left(\frac{y}{x}\right) g(y) d y, \tag{1}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(g, T^{*} f\right)=\int_{0}^{\infty} g(y) d y \int_{0}^{\infty} \frac{1}{x} \psi\left(\frac{y}{x}\right) f(x) d x . \tag{2}
\end{equation*}
$$

The integrals in (1) and (2) converge absolutely by the lemma and hence are equal. Thus

$$
(T g, f)=\left(g, T^{*} f\right)
$$

which, by definition of adjoint, shows that $T^{*}$ is the adjoint of $T$. Finally, since $\left\|T^{*}\right\|=\|T\|$, we have $\left\|T^{*}\right\| \leqq A$ and the proof is complete.

In passing we remark that the integrals defining $F$ and $G$ in the statement of Theorem 1 exist only almost everywhere.
4. Relation to Fourier transforms. We shall write $U f=g$ if $g$ is the Fourier cosine transform of $f$. Thus if $U f=g$ then

$$
g(y)=\underset{R \rightarrow \infty}{\operatorname{l.i.m.} .}\left(\frac{2}{\pi}\right)^{1 / 2} \int_{0}^{R} f(t) \cos y t d t \quad f \in L^{2}
$$

where 1.i.m. stands for limit in the $L^{2}$ mean. Furthermore

$$
g(y)=\left(\frac{2}{\pi}\right)^{1 / 2} \int_{0}^{\infty} f(t) \cos y t d t \quad \text { if } f \in L^{\prime} \cap L^{2}
$$

the above holding for almost all $y$.
It is well known that if $f \in L^{2}$ and $U f=g$ then $g \in L^{2}$ and $U g=f$. Moreover $U$ is a self-adjoint operator ( $U=U^{*}$ ).

It will be readily verified that everything we prove about the Fourier cosine transform $U$ will also hold for the Fourier sine transform.

Theorem 2. If $\psi$ is non-negative, $\psi \in L^{\prime}$, and $\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y<\infty$ then

$$
T U=U T^{*}
$$

where $T, T^{*}$ are as in Theorem 1.
Proof. It is sufficient to prove

$$
T U f=U T^{*} f \quad \text { for } \quad f \in L^{\prime} \cap L^{2}
$$

since $L^{\prime} \cap L^{2}$ is dense in $L^{2}$ and $T, T^{*}, U$ are continuous on $L^{2}$.
Accordingly, choose any $f \in L^{\prime} \cap L^{2}$ and let

$$
g=U f, \quad G=T g, \quad F=T^{*} f
$$

We need only show that $G=U F$. With $c=(2 / \pi)^{1 / 2}$ we have

$$
\begin{aligned}
G(x) & =\frac{1}{x} \int_{0}^{\infty} \psi\left(\frac{y}{x}\right) g(y) d y=\frac{c}{x} \int_{0}^{\infty} \psi\left(\frac{y}{x}\right) d y \int_{0}^{\infty} f(t) \cos y t d t \\
& =\frac{c}{x} \int_{0}^{\infty} f(t) d t \int_{0}^{\infty} \psi\left(\frac{y}{x}\right) \cos y t d y \\
& =c \int_{0}^{\infty} f(t) d t \int_{0}^{\infty} \psi(y) \cos x y t d y \\
& =c \int_{0}^{\infty} \frac{f(t)}{t} d t \int_{0}^{\infty} \psi\left(\frac{y}{t}\right) \cos x y d y \\
& =c \int_{0}^{\infty} \cos x y d y \int_{0}^{\infty} \frac{1}{t} \psi\left(\frac{y}{t}\right) f(t) d t \\
& =c \int_{0}^{\infty} F(y) \cos x y d y
\end{aligned}
$$

The integral in (3) converges absolutely since $\psi, f \in L^{\prime}$. This justifies the changes in order of integration and also shows that $F \in L^{\prime}$. Thus $G=U F$ which is what we wished to show.

Remark. If we set

$$
\begin{array}{ll}
\psi(y)=1, & 0 \leqq y \leqq 1 \\
\psi(y)=0, & y>1
\end{array}
$$

then if $G=T g, F=T^{*} f$ we have

$$
G(x)=\frac{1}{x} \int_{0}^{x} g(y) d y, \quad F(y)=\int_{y}^{\infty} \frac{f(x)}{x} d x
$$

From Theorem 2 we see that if $g=U f$ then $G=U F$. This is the theorem of Titchmarsh mentioned in the introduction.
5. A more general result. We may drop the hypothesis that $\psi \in L^{\prime}$ in Theorem 2. To see this choose any non-negative $\psi$ such that $\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y=A<\infty$ (but not necessarily such that $\psi \in L^{\prime}$ ). For $n=1,2, \cdots$ define

$$
\begin{array}{ll}
\psi_{n}(y)=\psi(y), & 1 / n \leqq y \leqq n ; \\
\psi_{n}(y)=0, & 0 \leqq y<1 / n ; n<y<\infty .
\end{array}
$$

Then $\int_{0}^{\infty} \psi_{n}(y) y^{-1 / 2} d y=A_{n}<\infty$ and, by the Lebesgue convergence theorem,

$$
\lim _{n \rightarrow \infty} A_{n}=A
$$

Moreover if $T, T_{n}$ are defined by $\psi, \psi_{n}$ as in Theorem 1 then $T-T_{n}$ is defined by $\psi-\psi_{n}$ and thus, by Theorem 1 ,

$$
\begin{equation*}
\left\|T-T_{n}\right\| \leqq A-A_{n} \rightarrow 0 \quad \text { as } n \rightarrow \infty . \tag{4}
\end{equation*}
$$

But $\psi_{n}$ obeys the hypotheses of Theorem 2. Hence

$$
T_{n} U=U T_{n}^{*}
$$

Letting $n \rightarrow \infty$ and using (4) we have

$$
T U=U T^{*} .
$$

We have thus shown that $T U=U T^{*}$ even for $T$ defined by a nonnegative $\psi$ for which we assume only $\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y<\infty$. We now state this in detail.

Theorem 3. Let $\psi$ be non-negative with $\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y<\infty$. Define the linear transformation $T$ on $L^{2}$ as follows:

$$
T g=G \text { means } G(x)=\frac{1}{x} \int_{0}^{\infty} \psi\left(\frac{y}{x}\right) g(y) d y .
$$

Then $T$ is a bounded operator on $L^{2}$. Moreover if $T^{*}$ is the adjoint of $T$ and $U$ is the Fourier cosine transform then

$$
T U=U T^{*} .
$$

Remark. This theorem, translated back into classical terminology, is the generalization of the theorem of Titchmarsh stated in the introduction.
6. Operators that commute with the cosine transform. In order for $T$ to be self-adjoint ( $T=T^{*}$ ) we see from the definition of $T, T^{*}$ in Theorem 1 that it is sufficient to have

$$
\frac{1}{x} \psi\left(\frac{y}{x}\right)=\frac{1}{y} \psi\left(\frac{x}{y}\right), \quad 0<x, y<\infty ;
$$

or

$$
\begin{equation*}
\psi(y)=\frac{1}{y} \psi\left(\frac{1}{y}\right), \quad 0<y<\infty \tag{5}
\end{equation*}
$$

Suppose then that we have a non-negative function $\psi$ defined on $(0,1]$ such that

$$
\begin{equation*}
\int_{0}^{1} \psi(y) y^{-1 / 2} d y<\infty \tag{6}
\end{equation*}
$$

and define $\psi(y)$ for $y>1$ by

$$
\psi(y)=\frac{1}{y} \psi\left(\frac{1}{y}\right), \quad 1<y<\infty
$$

Then if $y_{1}<1$ we have

$$
\psi\left(\frac{1}{y_{1}}\right)=y_{1} \psi\left(y_{1}\right)
$$

so that $\psi(y)=(1 / y) \psi(1 / y)$ for all $y>0$ (i.e. (5) holds). From (5) and (6) we have

$$
\int_{1}^{\infty} \psi(y) y^{-1 / 2} d y=\int_{1}^{\infty} \psi\left(\frac{1}{y}\right) y^{-3 / 2} d y=\int_{0}^{1} \psi(y) y^{-1 / 2} d y<\infty
$$

This and (6) imply

$$
\int_{0}^{\infty} \psi(y) y^{-1 / 2} d y<\infty
$$

so that the hypotheses of Theorem 3 hold. From (5) we conclude that the $T$ defined by $\psi$ is self-adjoint so that we have the following consequence of Theorem 3.

Theorem 4. Let $\psi$ be non-negative on $(0,1]$ with $\int_{0}^{1} \psi(y) y^{-1 / 2} d y<\infty$. Define $\psi(y)=(1 / y) \psi(1 / y)$ for $y>1$. Then if $T$ is as in Theorem 1

$$
T U=U T
$$

In other words $T$ commutes with the Fourier cosine transform.
